NivoVaria®

Rearing system for well trained aviary pullets

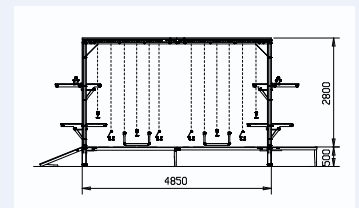

Benefits

NivoVaria® rearing system offers many advantages:

- ✓ High quality aviary pullets
- ✓ Effective natural training
- ✓ Simple to adjust to the development of the pullets
- ✓ Solid construction
- ✓ Sanitary
- ✓ Easy to clean

About NivoVaria®

The NivoVaria® rearing system fits the increasing demand for pullets trained to be placed in alternative housing systems for layers. Especially with aviary housing there is a demand for pullets which have been trained to jump and fly.

Training on NivoVaria

The system consists of portals with a tube winch system, which raises and folds back the hanging platforms located above the center slat area. Along each side, fold-away platforms are located which can be turned into a vertical or horizontal position. Feed and water are located on different platform levels. At the start of the rearing period the hanging platforms (Nivo Varia's) are placed on top of the center slat area. The fold-away platforms on each side are in a vertical position, so that the day-old chicks are locked in the center slat area. As the chicks get older, the hanging platforms will be raised and the fold-away platforms will be placed in a horizontal position so that the young pullets have access to the scratch area. In this way, the young pullets will be effectively trained for future housing in an aviary system.

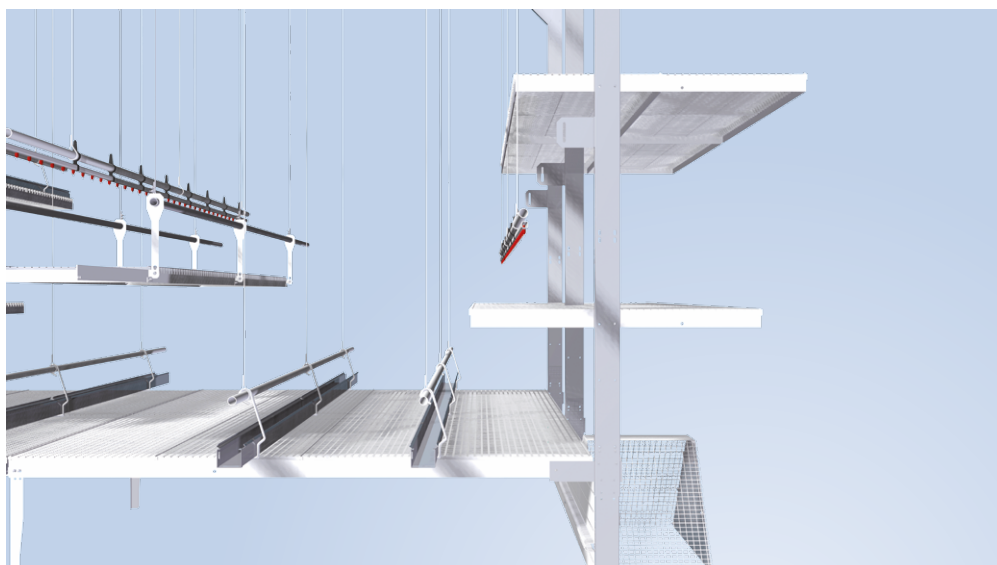

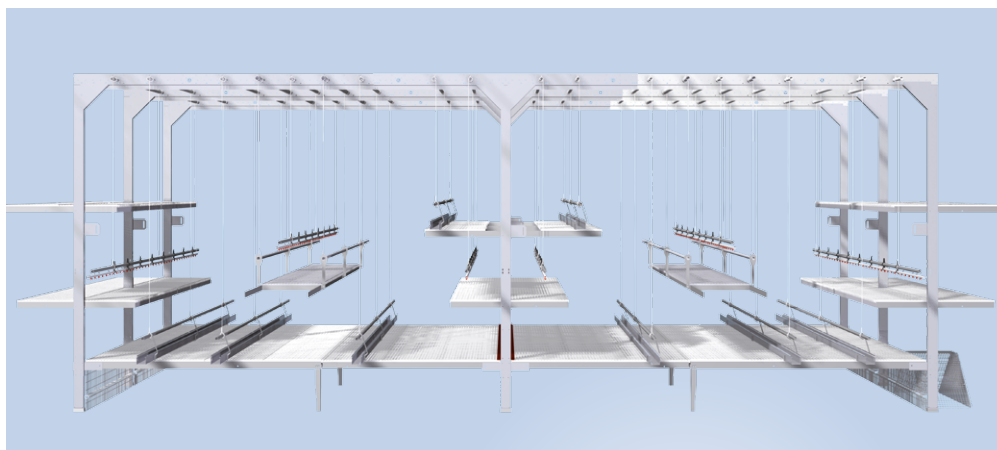

Rearing slats

The entire system has been fitted with a special plastic rearing slat with a small mesh size, which allows you to use thinner chick paper. The slat area is sturdy enough to walk on and the slats are non-conductive to mites. When the pullets have been shipped, the center slat area can be folded back and the NivoVaria platforms, feed and water systems can be raised which makes for easy cleaning.

NivoVaria®

Rearing system for well trained aviary pullets

Options

The NivoVaria® rearing system can be fitted with the following options:

- Manure belts under the slats, which can be an EMS+ manure belt system (single manure belt which can be rolled up) optional with manure belt aeration
- Platform stairs along the sides
- An extra slat area 1.2 m (4 ft.) wide outside the portals, which can be tilted during the start of the rearing period and can also be used as a walk-up slat. The walk-up slat area can be counted as living space.
- Combinations with wire mesh are a possibility
- With partitions
- Various widths of portals
